

# Restaurant bill calculator

## About the project

This project was created in Python and runs the program using the straightforward IDLE. The application requests the user's contact information, including name, phone number, and email address. It enables users to order food from the menu and makes culinary recommendations based on the orders they have made. The program emails the user to thank them for coming to the restaurant and informs them of the total cost of the food they ordered.

## How the project works

The user can use the project to order meals, get food suggestions, etc. by using lists of the food that are kept in a CSV file that is imported into Python.
